DETAILED ACTION

This final office action is in response to amendments filed on 6/28/06.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claims 4-7 are rejected under 35 U.S.C. 103(a) as being unpatentable over Applicant's Admitted Prior Art [AAPA], in view of Kim, US Patent no. 6,845,454.

Regarding claim 4, AAPA discloses an interface circuit provided for each of a first device set as a master side and a second device set as a slave side [two peripheral devices], for performing a serial data transmission between the first and second devices on the basis of a control signal [VBUS] which is output from the master side [page 1], comprising:

an oscillation circuit which generates a first clock signal for data transmission [master oscillator, page 2];

a detection portion which monitors the control signal output a detection signal when there is a change in the control signal [detection circuit, page 2].

a process control portion which generates a clock-control signal [page 2]; and a transmission function portion which performs a serial data transmission with the other device on the basis of the first clock signal [page 2];

Application/Control Number: 10/663,977

Page 3

Art Unit: 2116

AAPA discloses using a master oscillator to generate both a first high frequency clock signal and a frequency divided low frequency clock signal for signal detection while in a low power mode [pages 2 and 3]. Consequently, AAPA does not disclose disabling a master oscillator when in a low power mode. Kim teaches using a first master [high frequency] clock generator for generating a high frequency clock signal for use in a normal power mode and a second low frequency clock generator for generating a low frequency clock signal in a low power mode instead of using a single high frequency for generating both of the high and low frequency clock signals. The master [high frequency] clock generator is disabled when the system is in a low power mode [column 1, line 40 – column 2, line 23]. It would have been obvious to one of ordinary skill in the art to apply the Kim teachings to the AAPA interface circuit. Disabling a high frequency clock generator and using a separate low frequency clock generator for generating a low frequency clock signal in a reduced power mode reduces power consumption of the interface circuit [Kim, column 1, lines 57-61].

Regarding claims 5-7, AAPA, as described above, discloses a detection portion, which monitors the control signal to output a detection signal when there is a change in the detection signal. AAPA is silent as to the specific components that are inside the detection portion.

Applicant(s) numerous definitions of the internal circuitry of the detection portion (claims 5-7) is construed to be an admission that the criticality does not reside in the type of internal circuitry utilized in the detection portion and hence are obvious variations of one another.

Claims 8 and 9 are rejected under 35 U.S.C. 103(a) as being unpatentable over Applicant's Admitted Prior Art [AAPA] and Kim, US Patent no. 6,845,454, in view of Dehghan, US Patent no. 6,275,087.

AAPA, as described above, discloses a detection portion, which monitors the control signal to output a detection signal when there is a change in the detection signal. AAPA is silent as to the specific components that are inside the detection portion. AAPA is silent as to the specific components that are inside the detection portion and therefore do not explicitly disclose a noise removal circuit for removing noise components from the control signal. However, as shown by Dehghan [column 6, lines 40-52], using noise removal circuitry in signal detection circuits is well known in the art. It would have been obvious to one of ordinary skill in the art to use well known noise removal circuitry in the AAPA detection portion of the interface circuit.

Response to Arguments

Applicant's arguments with respect to claims 4-8 have been considered but are moot in view of the new ground(s) of rejection.

Conclusion

Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Paul B. Yanchus whose telephone number is (571) 272-3678. The examiner can normally be reached on Mon-Thurs 8:00-6:00.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Lynne H. Browne can be reached on (571) 272-3670. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
